1. ACKNOWLEDGEMENTS:

This study was carried out at Aker Hospital from 1980-86, during my appointment at the Clinical Chemistry Dept., Hormone Laboratory and Pediatric Dept., in co-operation with Medical Dept. B, and I wish to thank the heads of these departments: Karl Ørning, MD. Kenneth Try, MD. Nils Normann, PhD. Professor Øystein Aagenæs, MD. and Professor Harald Frey, MD. for ideal working conditions and great interest in this work. Øystein Aagenæs introduced me to the scientific work in diabetes during my appointment at the Pediatric Dept. from 1977-80, and offered valuable criticism concerning the protocol and manuscripts.

Most of all, I wish to thank Kristian F.Hanssen, MD., head of the Diabetic Unit and the Out-patient Clinic, Medical Dept. B, for his collaboration, his never-failing encouragement and enthusiasm, for the necessary criticism and stimulating discussions – and the warm friendship which developed during these years.

Furthermore, I wish to thank Olaf Brinchmann-Hansen, MD. Eye Dept. Ullevål Hospital, who accepted the enormous work-load with a good sense of humour and even more energy, and made detailed and frequent eye-examinations with valuable help from photographer Mr. Bjørn Jenshagen. I am grateful to Professor Trond Ganes, MD. Head of the Laboratory of Clinical Neurophysiology, Dept. of Neurology, The National Hospital, for his kind collaboration. I owe warm thanks to my friends at Medstat, Institute of Medical Statistics: Leiv Sandvik, MSc. Stig Larsen, MSc. and Trond Haider, MSc. who provided expert statistical support when planning the trial and evaluating the mass of data, which was computed by Mr. Gorm Jensøeg.

I am deeply indebted to the two specialist diabetes-nurses of the Out-patient Clinic, first Signe Landa (until 1983), and then Reidun Mosand, who took care of everything and everybody. Without them the trial would have failed.

A special thank to Mrs. Anne Elise Larsen, who provided expert technical assistance when developing and running the HbA1c and HbA1 analysis, and helped to organize the handling and storage of samples, supported by Mrs. Åse Gjestvang Petersen and Mrs. Marit Stykket; to Peter Torjesen, MSc. who developed the assays of insulin antibodies with the excellent technical assistance of Mrs. Kristine Fiskum; to Bente and Peter Kierulf, MD. who developed the assay of urine albumin; to Mrs. Reidun Slettemo, Trine Bjøro, MD. and Erlend Smeland, MD. who measured Glomerular Filtration Rate; to Mrs. Susan Sødal, Mrs. Andre Levorsen and Miss Ingunn Bergstad, Clinical Dietitians, for valuable advice and patient care. Many thanks to Stein Vaaler, MD. for friendly practical support and advice.

The staff of the following departments are also acknowledged for their collaboration: The Diabetes Unit, Clinic Laboratory, Out-Patient Clinic and Laboratory, Medical Dept. B., Clinical Chemistry Dept. and Hormone Laboratory, Out-patient Clinic, Eye Dept. and Laboratory of Clinic Neurophysiology. Thanks to Bent Rosenlund, MD. who introduced me to Notis wordprocessing, to Miss Vera Kriz, Mrs. Marianne Nygaard Larsen and to photographer Arne Pedersen for helping with the illustrations, and to the staff of the medical library.

I am grateful to all these co-workers, called the Oslo Diabetes Study Group. However, most of all I wish to express my gratitude to all forty-five participants in this study for impressive collaboration during so many years!
2. LIST OF PAPERS:

1. Dahl-Jørgensen K, Larsen AE.
   HbAl determination by agar gel electrophoresis after elimination of labile HbAl: A comparison with ion-exchange chromatography.

   Rapid tightening of blood glucose control leads to transient deterioration of retinopathy in insulin dependent diabetes mellitus: the Oslo study.

   Effects of intensified insulin treatment on various lesions of diabetic retinopathy: The Oslo Study.

   Effect of near normoglycemia for two years on progression of early diabetic retinopathy, nephropathy, and neuropathy: The Oslo Study.

   Increase in insulin antibodies during continuous subcutaneous insulin infusion and multiple injection therapy, in contrast to conventional treatment.
   Diabetes 1987; 36: 1-5.

   Effects of two years of near-normoglycemia on peripheral nerve function in insulin dependent diabetes mellitus.
   Acta Neurologica Scandinavica (Submitted for publication).

   Reduction of urinary albumin excretion after 4 years of continuous subcutaneous insulin infusion in insulin-dependent diabetes mellitus.
   Acta Endocrinol (Copenh.) (Submitted for publication).
